IBM's Internet Yellow Page Solution is a collection of IBM software and hardware products. These " off-theshelf " products were integrated with custom software to create a solution targeted at the needs of the telecommunication industry. This generic solution can be customized by IBM or customers to meet exact requirements.

Working closely with the telecommunications industry, IBM has developed an Electronic Yellow Page Solution which offers many advanced features over today's paper version. This rich set of function makes it second nature for consumers to " Let their fingers do the walking ".

Using IBM's award-winning database, DB2, with DB2 Extenders and DB2 World Wide Web Connection. IBM is able to deliver the power and flexibility of a multimedia database to the Internet.

Maintaining and managing large - scale internet sites is a major undertaking. Many tasks must be faced on a daily basis. Handling thousands of files in hundreds of directories Is one such task. IBM's Internet Yellow Pages uses DB2 to manage the data which most internet sites maintain in flat files. We provide administration and reporting tools to manage the data in your DB2 database.
